IPv6 Addressing

IMT Atlantique
Bretagne-Pays de la Loire
École Mines-Télécom

IPv6 Addressing

- ▶ 128-bit IPv6 address : 64-bit prefix + 64-bit Interface ID

IPv6 Addressing

- ▶ 128-bit IPv6 address : 64-bit prefix + 64-bit Interface ID
- ▶ The **64-bit prefix** is hierarchical
 - Identifies the network that the nodes are located
- ▶ The **64-bit Interface ID** identifies the network interface
 - Must be unique for that network
 - There are multiple mechanism to form the Interface ID

IPv6 Addressing

- ▶ 128-bit IPv6 address : 64-bit prefix + 64-bit Interface ID
- ▶ The **64-bit prefix** is hierarchical
 - Identifies the network that the nodes are located
- ▶ The **64-bit Interface ID** identifies the network interface
 - Must be unique for that network
 - There are multiple mechanism to form the Interface ID
- ▶ There are different kinds of IPv6 addresses :
 - Loopback (::1), and Unspecified (::)
 - Unicast Link-local (fe80::/10)
 - Unique Local Unicast
 - Global unicast (2000::/3)
 - Multicast (ff00::/8)
 - Anycast

Address Types and Scopes [RFC 4291]

- ▶ There are different types and scopes of IPv6 address:
 - The **type** of an IPv6 address indicates if a packet is transmitted in *unicast*, *anycast* or *multicast* mode.
 - The **scope** of an IPv6 address specifies *in which part of the network* it is valid.

Address Types and Scopes [RFC 4291]

- ▶ There are different types and scopes of IPv6 address:
 - The **type** of an IPv6 address indicates if a packet is transmitted in *unicast*, *anycast* or *multicast* mode.
 - The **scope** of an IPv6 address specifies *in which part of the network* it is valid.

- ▶ For *unicast* addresses, two defined scopes:
 - **Link-local scope**: are the *link-local* and the *loopback* addresses that can only be used on a single direct network (link).
 - **Global scope**: all other addresses, which means they are (or could be) globally routable, anywhere on the Internet.

IPv6 Addressing in 6LoWPAN

← 128 bits →
2001:660:3003:1:34ca:3b73:6543:210f / 64
Prefix *Interface ID*

► IPv6 addresses are compressed in 6LoWPAN

► Prefix

- Addresses within **6LoWPAN** typically contain common prefix.
- Supports up to 16 contexts (states).
- Nodes typically target one or few central nodes, i.e., root node(s).

► Interface ID

- Typically derived from L2 MAC addresses → autoconfiguration.
- Elided when Interface ID can be derived from L2 header.

IPv6 Header Format

IPv6 Header Format

Octet		0	1	2	3
Octet	Bit	0	1	2	3
0	0	<i>Version</i>		<i>Traffic Class</i>	
4	32	<i>Payload Length</i>		<i>Next Header</i>	<i>Hop Limit</i>
8	64	<i>Source Address</i>			
12	96				
16	128				
20	160				
24	192	<i>Destination Address</i>			
28	224				
32	256				
36	288				

IPv6 Header Format

- ▶ Version (4 bits), the constant 6 (bit sequence 0110).

IPv6 Header Format

- ▶ Version (4 bits), the constant 6 (bit sequence 0110).
- ▶ Traffic Class (6+2 bits), the bits of this field hold two values:
 - The first 6 bits are for the Differentiated Services (DS field), RFC 2474.
 - The last 2 bits are for the Explicit Congestion Notification (ECN), RFC 3168.

IPv6 Header Format

- ▶ Version (4 bits), the constant 6 (bit sequence 0110).
- ▶ Traffic Class (6+2 bits), the bits of this field hold two values:
 - The first 6 bits are for the Differentiated Services (DS field), RFC 2474.
 - The last 2 bits are for the Explicit Congestion Notification (ECN), RFC 3168.
- ▶ Flow Label (20 bits):
 - An identifier of a flow of packets between a source and destination.
 - The label 0 means the packet does not belong to any flow.

IPv6 Header Format

- ▶ Version (4 bits), the constant 6 (bit sequence 0110).
- ▶ Traffic Class (6+2 bits), the bits of this field hold two values:
 - The first 6 bits are for the Differentiated Services (DS field), RFC 2474.
 - The last 2 bits are for the Explicit Congestion Notification (ECN), RFC 3168.
- ▶ Flow Label (20 bits):
 - An identifier of a flow of packets between a source and destination.
 - The label 0 means the packet does not belong to any flow.
- ▶ Payload Length (16 bits):
 - The size of the payload in octets, including any extension headers.

IPv6 Header Format

- ▶ Version (4 bits), the constant 6 (bit sequence 0110).
- ▶ Traffic Class (6+2 bits), the bits of this field hold two values:
 - The first 6 bits are for the Differentiated Services (DS field), RFC 2474.
 - The last 2 bits are for the Explicit Congestion Notification (ECN), RFC 3168.
- ▶ Flow Label (20 bits):
 - An identifier of a flow of packets between a source and destination.
 - The label 0 means the packet does not belong to any flow.
- ▶ Payload Length (16 bits):
 - The size of the payload in octets, including any extension headers.
- ▶ Next Header (8 bits), specifies the type of the next header.

IPv6 Header Format

- ▶ Version (4 bits), the constant 6 (bit sequence 0110).
- ▶ Traffic Class (6+2 bits), the bits of this field hold two values:
 - The first 6 bits are for the Differentiated Services (DS field), RFC 2474.
 - The last 2 bits are for the Explicit Congestion Notification (ECN), RFC 3168.
- ▶ Flow Label (20 bits):
 - An identifier of a flow of packets between a source and destination.
 - The label 0 means the packet does not belong to any flow.
- ▶ Payload Length (16 bits):
 - The size of the payload in octets, including any extension headers.
- ▶ Next Header (8 bits), specifies the type of the next header.
- ▶ Hop Limit (8 bits), replaces the Time To Live (TTL) field in IPv4:
 - This value is decremented by one at each forwarding node, and the packet is discarded if it becomes 0.

IPv6 Header Format

- ▶ Version (4 bits), the constant 6 (bit sequence 0110).
- ▶ Traffic Class (6+2 bits), the bits of this field hold two values:
 - The first 6 bits are for the Differentiated Services (DS field), RFC 2474.
 - The last 2 bits are for the Explicit Congestion Notification (ECN), RFC 3168.
- ▶ Flow Label (20 bits):
 - An identifier of a flow of packets between a source and destination.

IMT Atlantique
Bretagne-Pays de la Loire
École Mines-Télécom

G3-PLC Protocol Stack

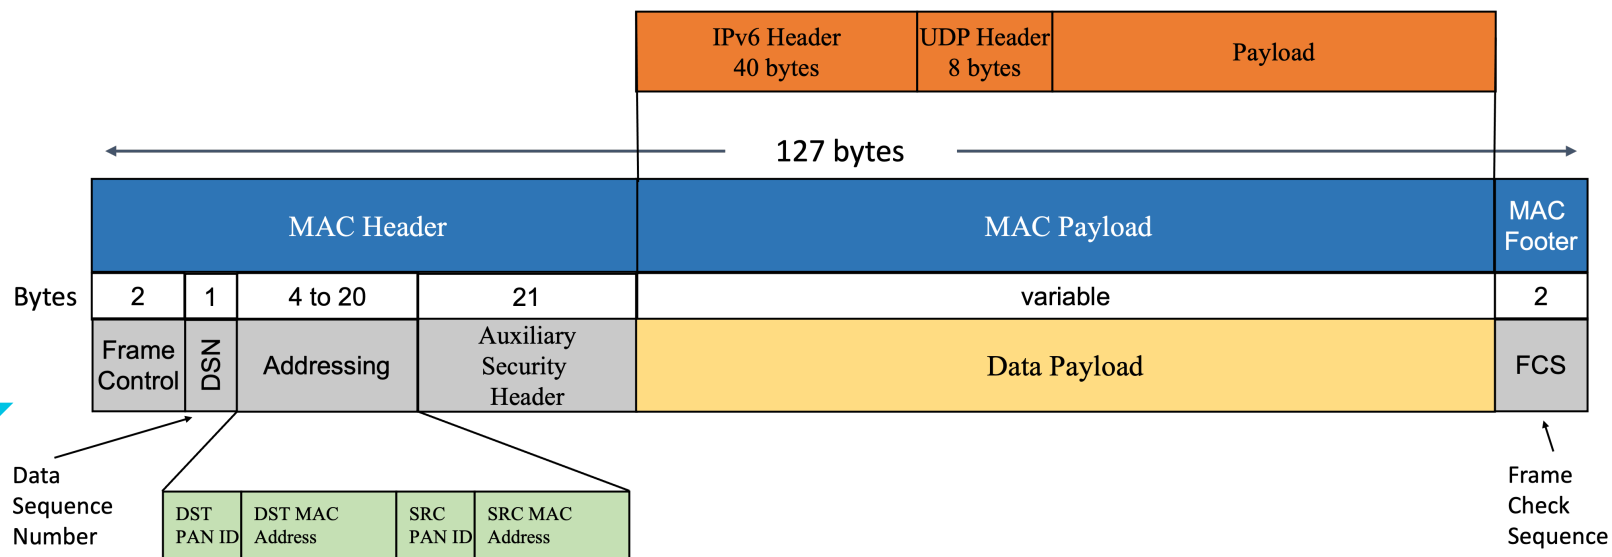

6LoWPAN Overview: RFC 4944, 6282, 8930, 8931

- ▶ The **6LoWPAN** is an adaptation layer allowing to transport IPv6 packets over IEEE Std 802.15.4 links.
 - Compression: reduces the size of 40-byte IPv6 header and higher protocols, i.e., UDP headers, RFC 6282.
 - Fragmentation: split (and reassembles) the IPv6 datagrams into smaller fragments, RFC 4944.
 - Fragment Delivery (Mesh-Under & Route-Over): RFC 4944.
 - 6LoWPAN Fragment Forwarding (6LFF): RFC 8930.
 - 6LoWPAN Selective Fragment Recovery mechanism: RFC 8931.

IEEE Std 802.15.4 vs IPv6 MTU: Problem Statement

- ▶ IEEE Std 802.15.4 has small MTU (i.e., 127 bytes).
- ▶ Header Size Calculation:
 - IPv6 header is 40 octets, UDP header is 8 octets.
 - IEEE Std 802.15.4 MAC header can be up to 25 octets (null security), **or** 25+21=46 octets (AES-CCM-128).
 - With the IEEE Std 802.15.4 frame size of 127 octets:
 - $127 - 25 - 40 - 8 = \mathbf{54}$ octets (null security)
 - $127 - 46 - 40 - 8 = \mathbf{33}$ octets (AES-CCM-128)

Encapsulation Header Format

- *encapsulated IPv6 datagram*

- *encapsulated LOWPAN_IPHC compressed IPv6 datagram*

- *encapsulated LOWPAN_IPHC compressed IPv6 datagram that requires **mesh addressing***

- *encapsulated LOWPAN_IPHC compressed IPv6 datagram that requires **fragmentation***

- *encapsulated LOWPAN_IPHC compressed IPv6 datagram that requires both **mesh addressing** and **fragmentation***

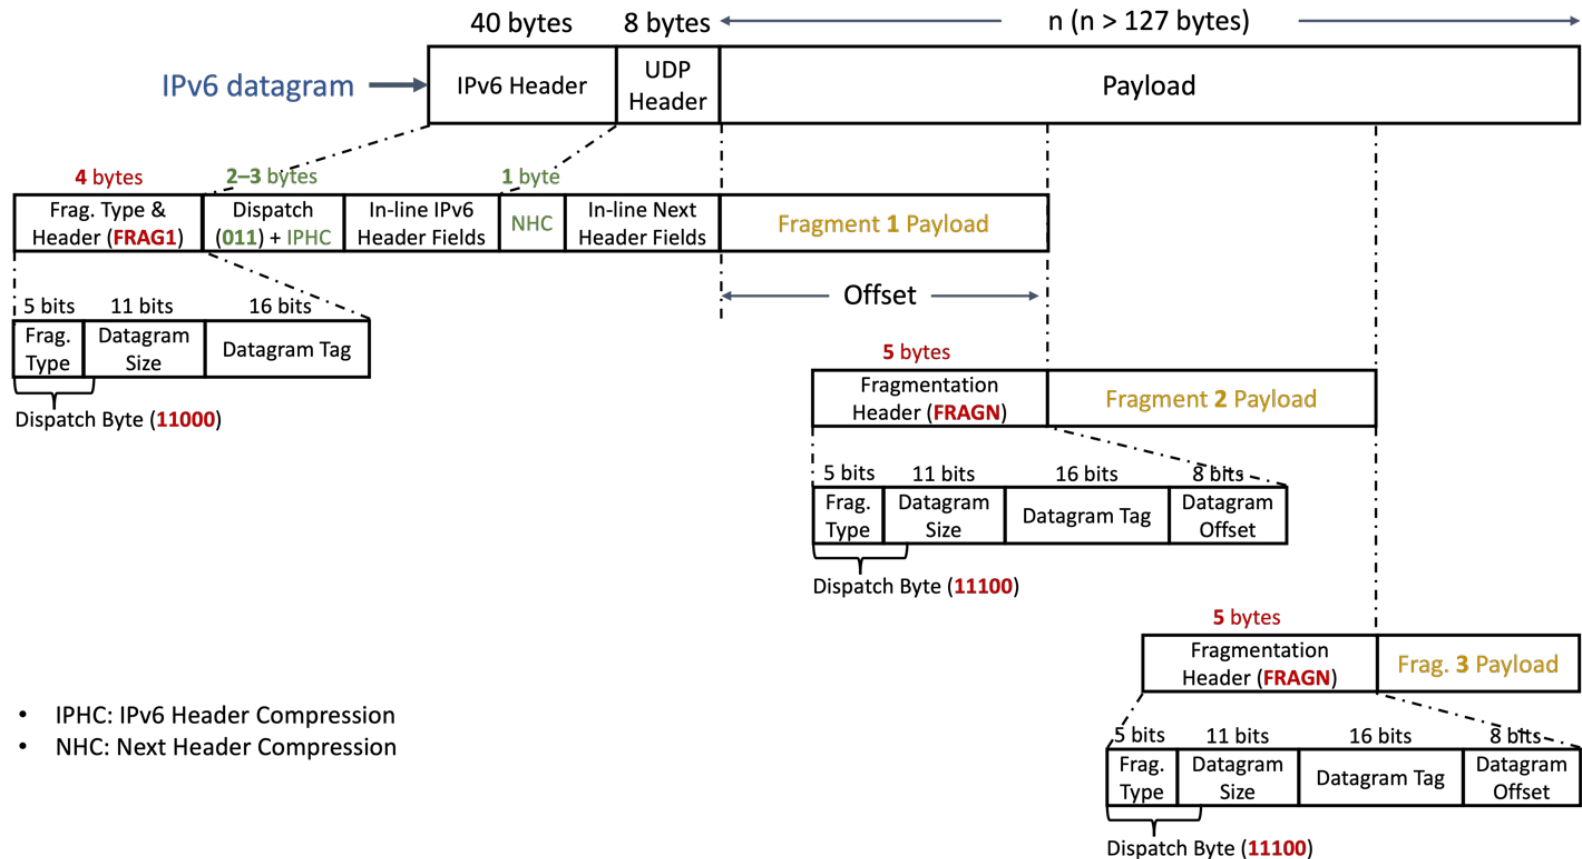

- *encapsulated LOWPAN_IPHC compressed IPv6 datagram that requires both **mesh addressing** and a **broadcast header** to support mesh broadcast/multicast*

6LoWPAN Dispatch Codes

<u>Bit Pattern</u>	<u>Short Code</u>	<u>Description</u>
00 xxxxxx	NALP	Not A 6LoWPAN Packet
01 000001	IPv6	Uncompressed IPv6 address
01 000010	LOWPAN_HC1	HC1 Compressed IPv6 header (<i>obsolete</i>)
01 010000	LOWPAN_BC0	BC0 Broadcast header
01 1	LOWPAN_IPHC	IPHC Compressed IPv6 header (<i>new version, RFC 6282</i>)
10 xxxxxx	MESH	Mesh routing header
11 000xxx	FRAG1	Fragmentation header (first fragment)
11 100xxx	FRAGN	Fragmentation header (subsequent fragment)

Compression and Fragmentation Overview

1. IPv6

1.1 IPv6 Addressing

1.2 IPv6 Header Format

2. 6LoWPAN Adaptation Layer

3. IPv6 Header Compression

4. Examples

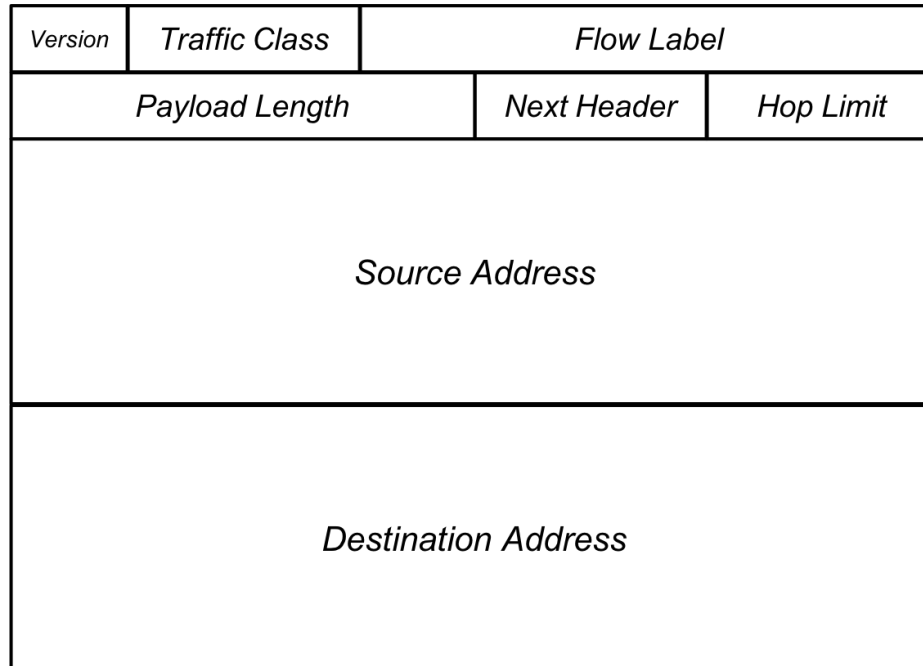

4.1 Link-local Multicast

4.2 Global Unicast

5. UDP Header Compression

IPv6 Header Compression (IPHC)

← Original IPv6 Header

Compressed Header (IPHC)

- Objective: transform the IPv6 Header to Compressed Header.
- By adding few extra bits which indicate how the packet is compressed.

IPHC: Overview

► Stateless compression

- It **does not require** the IoT node that process the compression and decompression of an IPv6 packet **to store any configuration information locally**, which is used to decide how that packet needs to be compressed or decompressed.

IPHC: Overview

► Stateless compression

- It **does not require** the IoT node that process the compression and decompression of an IPv6 packet **to store any configuration information locally**, which is used to decide how that packet needs to be compressed or decompressed.

► Flow-independent

- Two packets belonging to the same traffic flow might be compressed and decompressed in different ways.
- No need to maintain a state of the flow which the packets belong.

IPHC: Overview

► Stateless compression

- It **does not require** the IoT node that process the compression and decompression of an IPv6 packet **to store any configuration information locally**, which is used to decide how that packet needs to be compressed or decompressed.

► Flow-independent

- Two packets belonging to the same traffic flow might be compressed and decompressed in different ways.
- No need to maintain a state of the flow which the packets belong.

► 6LoWPAN is Layer 2 (L2) independent protocol.

The Default Elided IPv6 Header Fields

<i>Version</i>	<i>Traffic Class</i>	<i>Flow Label</i>	
<i>Payload Length</i>		<i>Next Header</i>	<i>Hop Limit</i>
<i>Source Address</i>			
<i>Destination Address</i>			

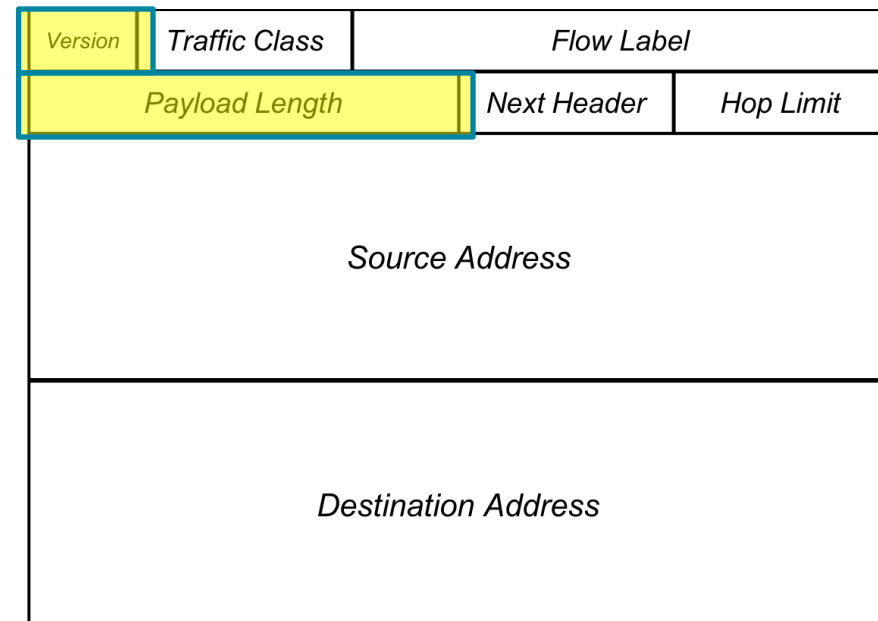

The Default Elided IPv6 Header Fields

- The version is almost always 6.

<i>Version</i>	<i>Traffic Class</i>	<i>Flow Label</i>	
<i>Payload Length</i>		<i>Next Header</i>	<i>Hop Limit</i>
<i>Source Address</i>			
<i>Destination Address</i>			

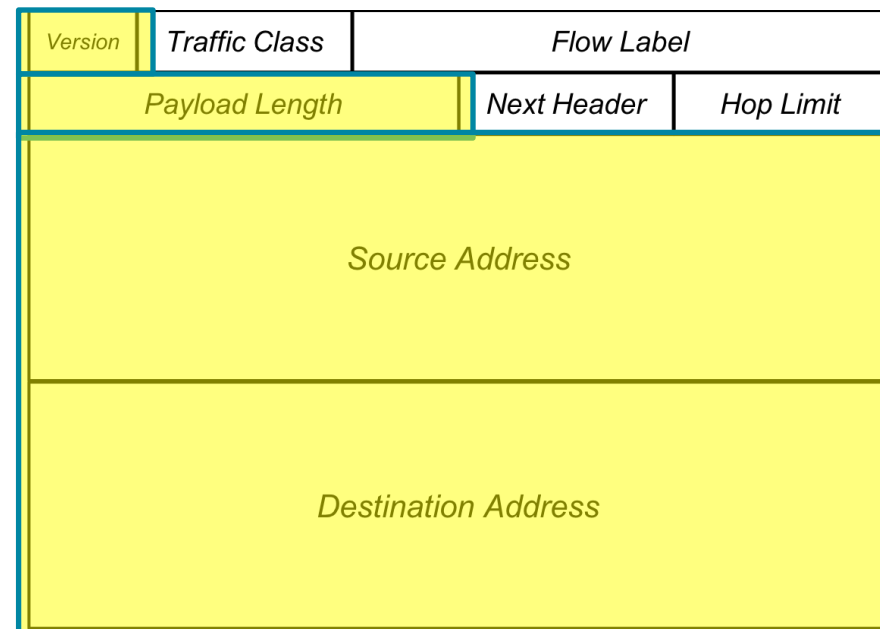

The Default Elided IPv6 Header Fields

- ▶ The version is almost always 6.
- ▶ The Payload length can be derived from L2 header.

The Default Elided IPv6 Header Fields

- ▶ The version is almost always 6.
- ▶ The Payload length can be derived from L2 header.
- ▶ Source and Destination Addresses can be elided (link-local) and/or compressed depending on the “context” of the transmitted packet.

IPHC base Encoding

- ▶ TF : Traffic Class and Flow Label
 - 0: Carried Inline (ECN+DSCP+Flow), 1: ECN+Flow, 2: ECN+DSCP, 3: All zero
- ▶ NH (Next Header compression)
 - 0: Carried Inline, 1: Next Header is compressed (allows L4 compression)
- ▶ HLIM (Hop Limit = Inline, 1, 64, 255) : well known values
 - 0: Carried Inline, 1: 1, 2: 64, 3: 255
- ▶ CID (Context Identifier Extension)
 - 0: No 1-byte CID identifier, 1: 1-byte identifier follows
 - An additional 8-bit CID field immediately follows the (DAM) field.
 - Add a context to allow 16 source and destination prefixes
- ▶ SAC/DAC (Source/Destination Address Compression)
 - 0: Stateless, 1: Stateful, i.e., Context-based
- ▶ SAM/DAM (Source/Destination Address Mode)
 - 0: 16 bytes inline, 1: 8 bytes inline, 2: 2 bytes inline, 3: elided
- ▶ M (Multicast Destination)
 - 0: Destination is not multicast, 1: Destination is multicast

Traffic Class and Flow Label Compression

TF = 11 [ECN = 0, DSCP = 0, Flow Label = 0]

Next Header Compression

NH = 0

in-line IPv6 Bits	Next Header	in-line IPv6 Bits	Uncompressed Next Header
-------------------	--------------------	-------------------	--------------------------

NH = 1

in-line IPv6 Bits	in-line IPv6 Bits	NHC	Uncompressed Next Header
-------------------	-------------------	------------	--------------------------

Hop Limit Compression

Source Address Compression (SAC) and SAM

SAC \ SAM	00	01	10	11
IID		64 first prefix bits are elided. IID is fully sent.	112 first prefix bits are elided. Last 16 IID bits are sent.	All 128 bits are elided.
0 : Stateless / Link Local	The full address (128 bits) is carried in-line.	The prefix is link-local i.e., fe80::/64	The prefix is link-local i.e., fe80::0:ff:fe00:/112	The prefix is link-local i.e., fe80::/64. IID is taken from L2 source address.
1 : Stateful / Global	The full address (128 bits) is carried in-line.	The prefix is given by the context, and 64 bits are carried in-line.	The prefix is given by the context. IID starts with 0000:00ff:fe00: and 16 bits are carried in-line.	The prefix is given by the context. IID is taken from L2 source address.

Destin. Address Compression (DAC) and DAM

DAM M, DAC	00	01	10	11
00 : Stateless / Link Local	The full address (128 bits) is carried in-line.	The first 64 bits (prefix is fe80::/64) are elided. IID (64 bits) is sent.	The first 112 bits (prefix is fe80::0:ff:fe00:/112) are elided. IID (16 bits) is sent.	The address is fully elided. Prefix is fe80::/64. IID is taken from L2 source address.
01 : Stateful / Global	Reserved	The prefix (64 bits) is given by the context. IID (64 bits) is sent.	The prefix (112 bits) is given by the context. IID starts with 0000:00ff:fe00: and 16 bits sent.	The address is fully elided. The prefix is given by the context. IID is taken from L2 source address
10 : Stateless / Link Local Multicast	The full address is carried in-line.	48 bits are sent. The multicast address takes the form: ffXX::00XX:XXXX:XXXX	32 bits are carried in-line. The multicast address takes the form: ffXX::00XX:XXXX	8 bits are carried in-line. The multicast address takes the form: ff02::00XX
11 : Stateful / Global Multicast	48 bits are sent. The format follows Unicast-Prefix-based IPv6 Multicast Addresses [RFC 3956]. Context value contains the Rendezvous Point address.	Reserved	Reserved	Reserved

6LoWPAN : Compression Example

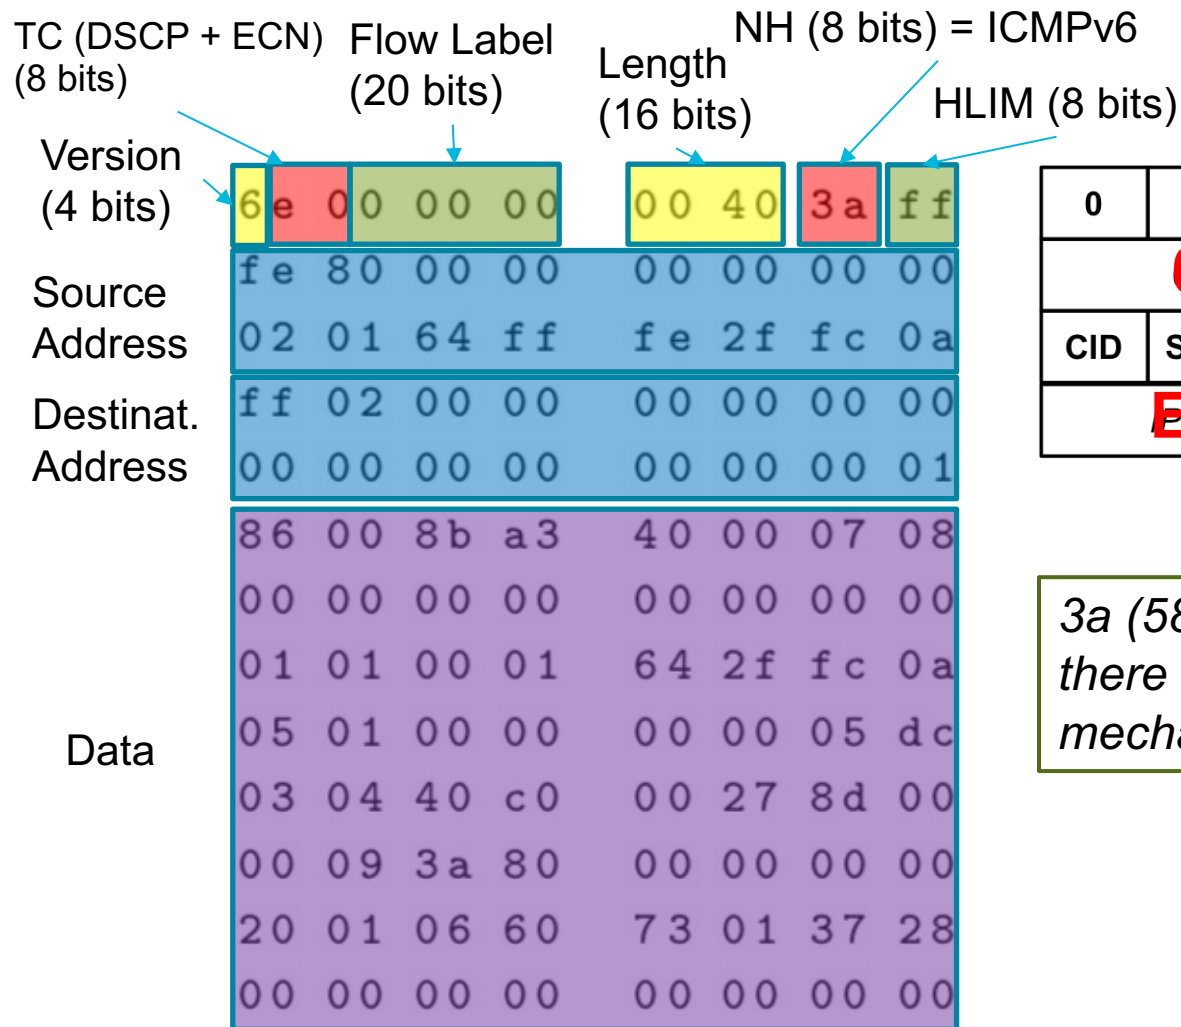

TC (DSCP + ECN) (8 bits) Flow Label (20 bits) Length (16 bits) NH (8 bits) = ICMPv6 HLIM (8 bits)

Version (4 bits)	6	e	0	0	0	0	0	0	0
Source Address	f	e	8	0	0	0	0	0	0
Destinat. Address	0	2	0	1	6	4	f	f	0
Data	8	6	0	0	8	b	a	3	4
	0	0	0	0	0	0	0	0	0
	0	1	0	1	0	0	0	1	6
	0	5	0	1	0	0	0	0	4
	0	3	0	4	4	0	c	0	2
	0	0	0	9	3	a	8	0	0
	2	0	0	1	0	6	6	0	7
	0	0	0	0	0	0	0	0	3

Compressed Header

0	1	2	3	4	5	6	7
011			TF		NH	HLIM	
CID	SAC	SAM		M	DAC	DAM	
IPv6 Header fields ...							

6LoWPAN : Compression Example

Compressed Header

0	1	2	3	4	5	6	7
011			10		0	HLIM	
CID	SAC	SAM		M	DAC	DAM	
E0 3A IPv6 Header fields ...							

3a (58 in decimal) in NH is ICMPv6 → there is not a compression mechanism (yet) for ICMPv6 protocol.

6LoWPAN : Compression Example

TC (DSCP + ECN) (8 bits) Flow Label (20 bits) Length (16 bits) NH (8 bits) = ICMPv6 HLIM (8 bits)

Version (4 bits)	6	e	00	00	00	00	00
Source Address	fe	80	00	00	00	00	00
Destinat. Address	02	01	64	ff	fe	2f	fc
Data	0a	ff	02	00	00	00	00
	00	00	00	00	00	00	00
	00	00	00	00	00	00	01
	86	00	8b	a3	40	00	07
	00	00	00	00	00	00	00
	01	01	00	01	64	2f	fc
	05	01	00	00	00	00	05
	03	04	40	c0	00	27	8d
	00	09	3a	80	00	00	00
	20	01	06	60	73	01	37
	00	00	00	00	00	00	00

Compressed Header

0	1	2	3	4	5	6	7
011			10		0	11	
0	0	SAM		M	DAC	DAM	
IPv6 Header fields ...							

The prefix starts with FE80, thus we have link-local IPv6 addresses → CID = 0, SAC = 0.

Example 2

Global Unicast

Compressed Header

0	1	2	3	4	5	6	7
011			11		0	10	
0	SAC	SAM		M	DAC	DAM	
06 Header fields ...							

There is not direct indication regarding the Prefix (if it is given or not by the Context) → CID = 0

6LoWPAN : Compression Example

TC (DSCP + ECN) (8 bits) Flow Label (20 bits) Length (16 bits) NH (8 bits) = TCP
HLIM (8 bits)

Version (4 bits)	6	0	0	0	0	0	0	0	0
Source Address	2	0	0	1	0	6	6	0	7
Destinat. Address	0	2	2	3	d	f	f	f	e
Data	a	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0
	e	b	0	8	0	0	5	0	1
	3	b	1	a	5	e	5	a	8
	f	6	a	0	0	0	0	0	0
	0	3	e	7	6	0	7	2	7
	4	7	4	5	5	4	2	0	2
	7	4	6	d	2	e	6	7	6
	7	4	6	d	7	7	7	6	3
	2	e	3	4	2	6	7	5	7
	3	3	3	0	3	7	2	6	7
	3	d	3	2					5

Compressed Header

0	1	2	3	4	5	6	7
011			11		0	10	
CID	SAC	SAM		M	DAC	DAM	
06 Header fields ...							

- The Prefix **does not** start with FE80, thus **no** indication for Link Local address
→ Global Address (SAC = 1)
- Then, since CID = 0 → SAM = 00.

6LoWPAN : Compression Example

TC (DSCP + ECN) (8 bits) Flow Label (20 bits) Length (16 bits) NH (8 bits) = TCP
HLIM (8 bits)

Version (4 bits)	6	0	0	0	0	0	0	0	0
Source Address	2	0	0	1	0	6	6	0	7
Destinat. Address	0	2	2	3	d	f	f	f	e
Data	e	b	0	8	0	0	5	0	1
	3	b	1	a	5	e	5	a	8
	f	6	a	0	0	0	0	0	0
	0	3	e	7	6	0	7	2	7
	4	7	4	5	5	4	2	0	2
	7	4	6	d	2	e	6	7	6
	7	4	6	d	7	7	7	6	3
	2	e	3	4	2	6	7	5	7
	3	3	3	0	3	7	2	6	7

2a 00 14 50 40 07 08 03
00 00 00 00 00 00 10 04

- Compressed Header = 2 bytes
- IPv6 Header fields = 33 bytes →
(NH = 1 byte, IPv6 addresses 32 bytes, 16 for source and 16 for dest.)

Compression Result:
from 40 Bytes to 35 Bytes

OUTLINE

1. IPv6

1.1 IPv6 Addressing

1.2 IPv6 Header Format

2. 6LoWPAN Adaptation Layer

3. IPv6 Header Compression

4. Examples

4.1 Link-local Multicast

4.2 Global Unicast

5. UDP Header Compression

UDP Header Format

	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
0	Source Port																Destination Port															
4	Length																Checksum															

► Source port (16 bits):

- This field identifies the port of the transmitter, when used, it should be assumed to be the port to reply to. If not used, it should be zero.

► Destination port (16 bits):

- This field identifies the port of the receiver.

► Length (16 bits):

- This field specifies the length in bytes of the UDP header and UDP data.

► Checksum (16 bits):

- It is used for error-checking of the header and data.
- This field is optional in IPv4, and mandatory (*obligatoire*) in IPv6.
- The field carries all-zeros if unused.

UDP Header Compression

	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
0	Source Port																Destination Port															
4	Length																Checksum															

- Assume common values for header fields and define compact forms.
 - Ports within 61616 to 61632 (4 bits).

UDP Header Compression

	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
0	Source Port																Destination Port															
4	Length																Checksum															

- ▶ Assume common values for header fields and define compact forms.
 - Ports within 61616 to 61632 (4 bits).
 - Length can be derived from IPv6 header Length information.
 - Checksum always carried in-line (RFC 4944) or **elided** (RFC 6282).

UDP LOWPAN_NHC Format

	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
0	Source Port																Destination Port															
4	Length																Checksum															

► Assume common values for header fields and define compact forms.

- Ports within 61616 to 61632 (4 bits).
- Length can be derived from IPv6 header Length information.
- Checksum always carried in-line (RFC 4944) or **elided** (RFC 6282).

► C (1 bit), the field represents the Checksum:

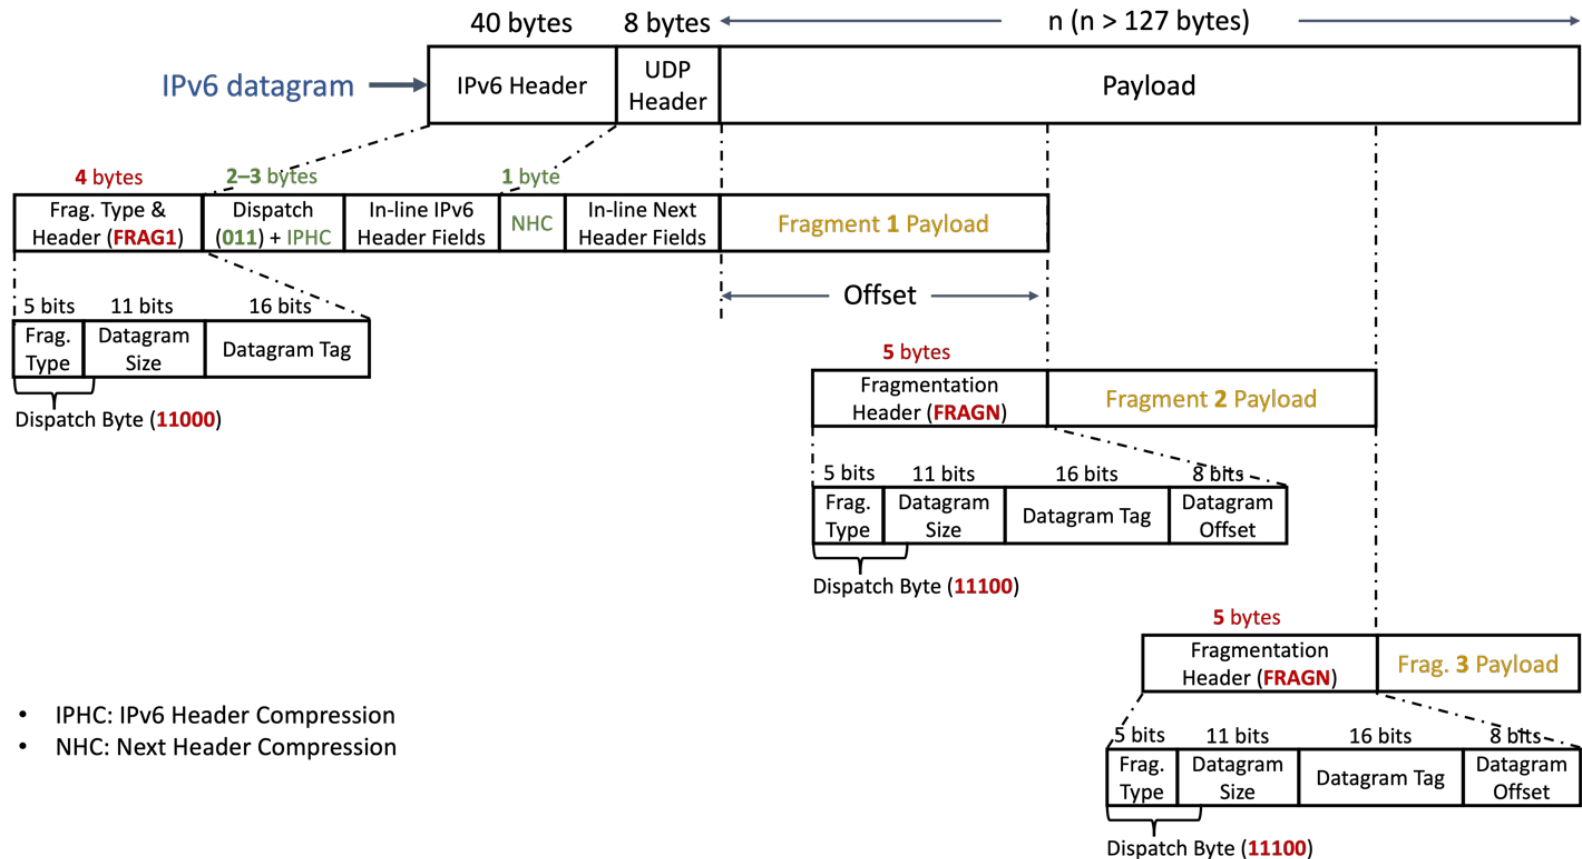

- 0: the Checksum is not compressed, and all its 16 bits are carried in-line.
- 1: the Checksum is elided.

► P (2 bits), the two bits field represents the Ports:

- 0 → in-line
- 1 → elide first 8 bits of Destination Port
- 2 → elide first 8 bits of Source Port
- 3 → elide 12 bits of Source and Destination Ports

0	1	2	3	4	5	6	7
1	1	1	1	0	C	P
